 Listen this article

With very good physical and mechanical properties, calibrated sheathing sheet is ultimate in plywood. The rigid laminated surface not only prevents moisture absorption but also ensures excellent abrasion resistance in aggressive conditions and smooth finish to concrete formwork. It has been designed to suit any and every application needs of construction industry where durability, versatility, high bending strength, rigidity, stability, accuracy and tolerance to humidity parameters of performance value are critical.

Tips for optimum utilisation of shuttering plywood

Protect from weather: Store the formworks and the loose formwork panels against sun and rain.

Use standard tool: Film faced plywood can be cut shaped and drilled using standard wood working stools.

Seal edges and holes: Seal the resulting raw edges and holes with suitable water-resistant paint.

Oil panels before use: A suitable approved release agent must be used to ensure cleaner and easier striking and also more re-users.

Back face fastening: To achieve the best results, it is recommended that the plywood should be fastened to the formwork support members from the back of the panel.

Avoid falling from height: Plywood panels should be handled very carefully when moving high above the ground to

Clean after use: Plywood panels should be cleaned carefully with water or damaging the stream after use. Avoid da surface when cleaning the concrete residues.
